

Student_Course data using Power Query by Power BI

For this report, the power query techniques I have used, I am writing down below-

Steps:

- 1) Import the data on Power BI
- 2) Transform the data, Removed the null/extra columns, null rows.
- 3) Remove the duplicate, null values. (Original Excel file does not change)
- 4) From “add column”-> “column from examples”, we’ll see a magical that for HaeilyA , HarveyR , power bi automatically defines the formula and create the whole column by own.
- 5) now from “add column”-> “conditional column” , we give a condition if Reg_date >15/12/2022....then it goes o=for Feb team and else go for April team.
- 6) now from “add column”-> “conditional column” , we give a condition if Fee_paid =null... “not paid”, =500 “fully paid”, else “partly paid”
- 7) now go to “home”, “close & apply” , transformed data is now ready for report view , go & enjoy the power bi
